3.4 Container element - aggregation

The container element can be used to combine elements in cadwork. In addition to the IfcElementAssembly, the following merges can be generated:

- IfcDoor (Door)
- IfcStair (Stairs)
- IfcWindow (Window)
- Without summary

IfcTypes - automatic assignment

One option for automatically assigning IFC types is the **BIM... -> Assign IFC type automatically** F-key function in the Modfiy categroy. With this function all active elements that have no IFC type are assigned a suitable IFC type. If the type cannot be automatically uniquely defined, the element is assigned the IFC type *IfcBuildingElementProxy*, with which at least a generally valid description is assigned.
