

## 6.1.2 Modeling from PDF 1

### Video Tutorial

### Description

#### PDF

PDF points can be displayed via the control box in the status bar

#### Ceilings and similar elements:

1. draw area 
2. add or remove additional points --> modification toolbar  $\pm P$  & + or -
3. cut openings --> toolbar cut or cut through 
4. convert surface into a volume --> modification toolbar 
5. set Z-height in Modify area
6. define inclination
  - element converted into a mesh **M** (modification toolbar)
  - Stretch individual points with key **7**
  - Set the bend angle in the Modify area to 0 so that all 3 corners are visible. Then flip edges if necessary.

#### Walls:

1. catalog element wall use 
2. two walls can be connected  (modification toolbar) or an end angle can be defined (modify area)
3. add openings  
4. openings specially
  - Model opening , weld if necessary 
  - Define volume as IFC type Opening (In the Modify area) and then select the wall as a connecting element

**\*Shortcut:** If several slabs have been modelled, the slabs can be cut with the touching walls. Activate all ceilings and press key **C + W + A**, then the ceilings cut volumes into the walls. This way the height of the walls does not have to be modelled individually.
